Examining Treatment Strategies for Cholera Incorporating Spatial Dynamics

Group: Plague Doctors
Jessa Mallare, Sid Reed, Daniel Segura, Aref Jadda

McMaster University

Instructor: Dr. David Earn

April 8, 2019

Introduction

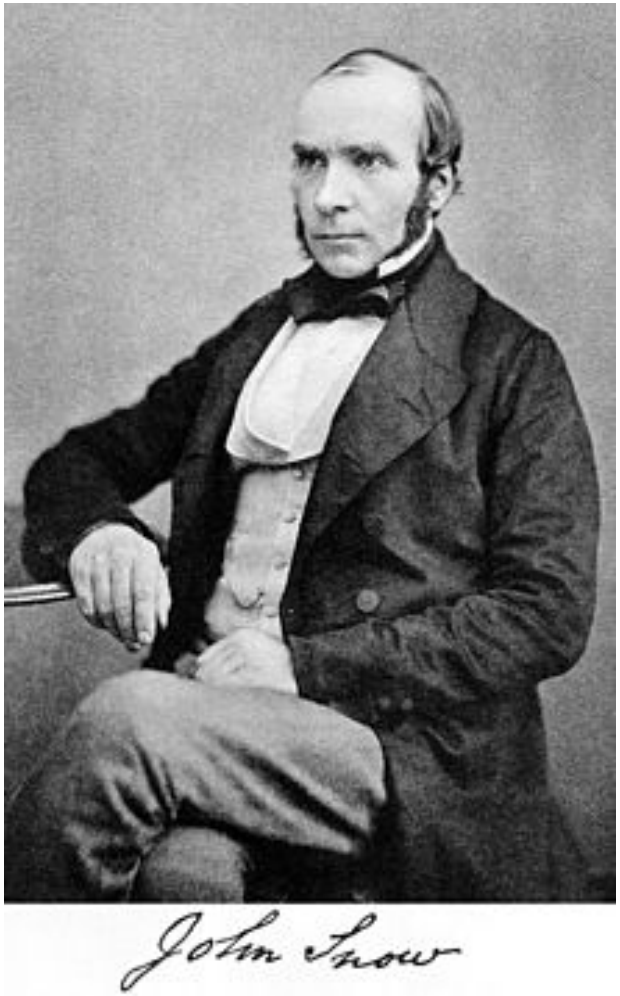
- Treatments have not always gone as planned in history
- Cholera

Some Biology on Cholera

- Vibrio cholerae
- Colonize small intestines
- 10
- Causes dehydration

Outbreaks in London (19^{th} Century)

- 1832, 1849, 1854, 1866
- Miasma Theory
- John Snow



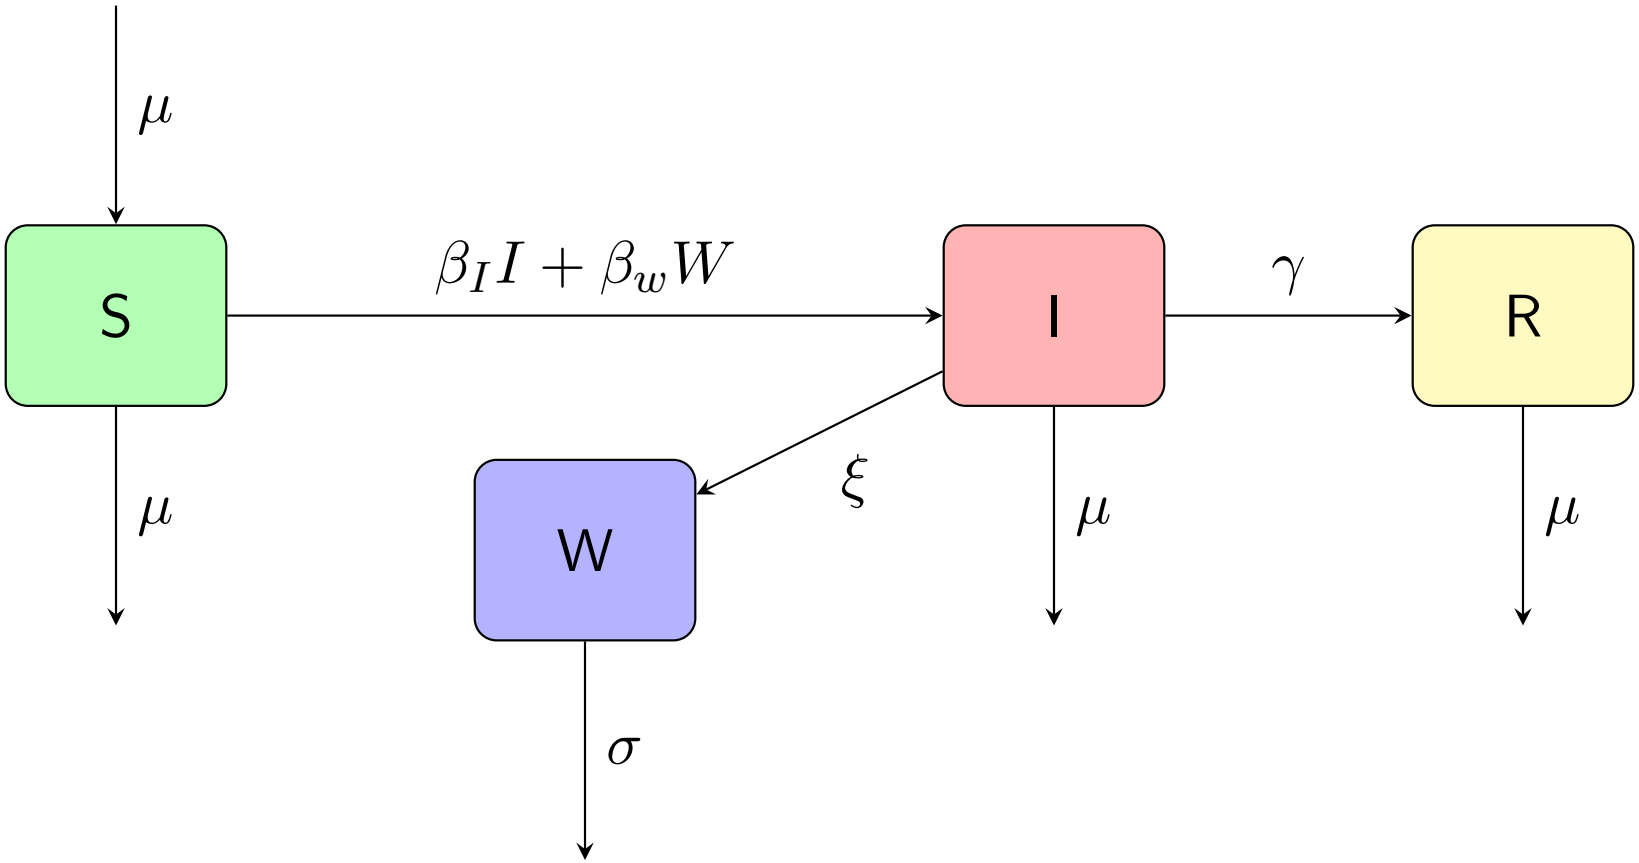
Single-Patch Model

- Entire population (N) included
- 3 Compartments : S, I, R
- Compartment values are proportional
- Environment (Water)

SIRW Model Assumptions

- Birth Rate = Natural Death Rate and is constant
- Homogenous susceptibility to cholera across population
- No waning immunity
- No latency period
- Only infected individuals can infect the water sources
- Water source is still

SIRW Model



SIWR Model Phase Portrait

R_0 Calculation

Equilibria and Stability

Final Size

Effect of the 19th Century Treatments

Multi-Patch Model

Multi-Patch Model Assumptions

- No dispersal of individuals
- Infected individuals can infect the susceptible in neighboring patches
- All patches neighbouring i have the same transmission rate to patch i

Multi-Patch Model Simulation

Treatment Strategies For Cholera

1. Sanitation of Water
2. Vaccinations
3. Antibiotics

Sanitation of Water

Vaccinations

Antibiotics

Comparing the Treatment Strategies

Comparing the Treatment Strategies

Conclusions and Further Research

- 19th century outbreaks
- Significance of the using multi-patch model
- Our treatment simulations suggest...
- Further research on the spread of water borne diseases like cholera can be done in areas like...

Thank you!
